THE CLIP TRIALS: A community-based approach to health research

Integrated community engagement activities with existing health systems

> Strengthened relationships for Local capacity long-term sustainability

> > Knowledge

Promoted capacity building

Feasibility studies provided insights into community engagement Adapted to confety strategies for better outcomes

Engagement

e.g. Flexibility to provide separate sessions for men and women meant more people were reached

Basic vital signs and blood pressure measurements shared with women

Information about potential complications were well received by community

Many unaware of the severity of the condition

A community of care

Our guiding principles were key to the success of the trials

97,035

participants engaged across three countries 23,106

community engagement sessions

Community members saw value in engagement

may have increased access to basic care

INDIA
